

Water Quality Report

[SITE_NAME] Reporting Period: [START_DATE] to [END_DATE]

Coordinates	[LAT, LONG]
Water Body Type	[Freshwater / Brackish / Estuarine / Marine]
Client / Contract	[CLIENT_NAME]
Report Date	[REPORT_DATE]
Prepared By	Clean Earth Rovers
Status	[Normal / Watch / Action Required]

1. Summary

[Three to five sentences: overall status, whether conditions held within the site baseline, whether any pollution event signatures were identified, and the principal recommendation. If no events were identified, state that here and confirm that diel and tidal rhythms tracked the site baseline.]

2. Parameter Data

Parameter	Site Baseline	Min	Max	Mean	Median	Flag
Temperature (°C)	[min-max]					
Dissolved Oxygen (mg/L)	[min-max]					
ORP (mV)	[min-max]					
Conductivity (µS/cm)	[min-max]					
pH	[min-max]					
Turbidity (NTU)	[min-max]					

Flag values: Normal, Elevated, Low, or Exceedance relative to the site baseline.

3. Parameter Analysis

Brief interpretation per parameter: dominant pattern (diel, tidal, event-driven, or flat), behavior against baseline, and any notable excursions with timestamps. Cover only what is relevant; omit parameters that held steady.

Temperature — []

Dissolved Oxygen — []

ORP — []

Conductivity — []

pH — []

Turbidity — []

4. Event Detection

[Include this section only if one or more events were identified. If none were identified, the no-event statement in Section 1 stands and this section is omitted.]

Event 1

Type: [Sewage / Algal bloom / Stormwater / Industrial / Thermal / Saltwater intrusion / Acidic input / Hypoxia / Inconclusive]

Window: [start] to [end]

Severity: [Low / Moderate / High]

Parameter movements: [each parameter that moved, with direction and magnitude.]

Interpretation: [Why the correlated movements support this classification and not an alternative, including whether the change was a step departure from the diel or tidal rhythm or fell within normal variation. Cite supporting context: rainfall record, tidal stage, vessel activity, known nearby discharges.]

Follow-up: [Grab sample / Notify stakeholder / Continue monitoring / Investigate source.]

5. Data Quality

Check	Result	Notes
Data completeness	[%]	[Gaps and causes]
Calibration status	[Pass / Review]	[Last calibration date per sensor]
Drift indicators	[None / Present]	[Slow one-directional trends]
Biofouling indicators	[None / Present]	[Monitoring duration; condition on retrieval]
Sensor agreement	[Pass / Review]	[DO-ORP coupling; EC temperature compensation]

6. Recommendations

Operational: [Calibration, cleaning, redeployment, sensor replacement.]

Investigative: [Grab samples for lab confirmation, expanded testing, source tracing.]

Stakeholder: [Notifications to client, port authority, or regulator; compliance reporting if triggered.]
